

Red means uncertain/major revision needed
Pink means it is a suggestion
but maybe not necessary

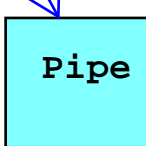

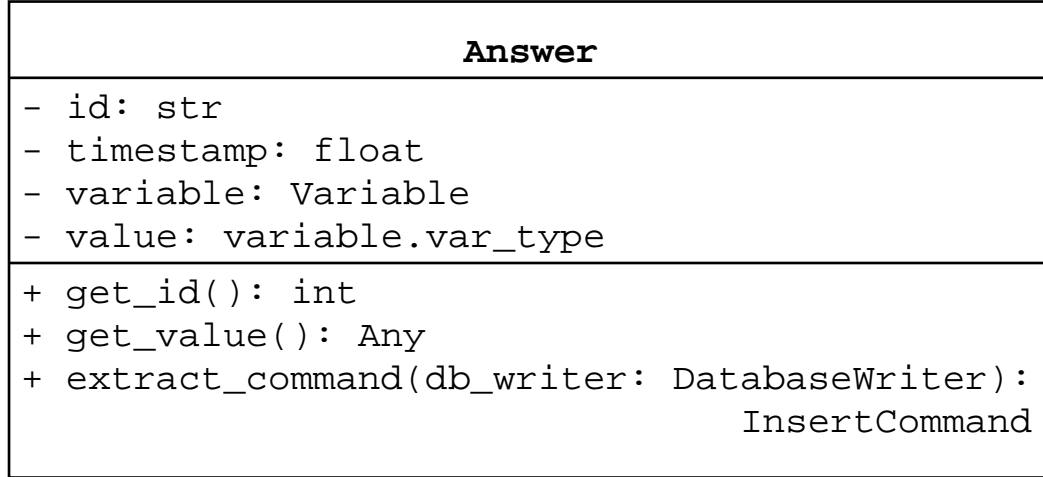

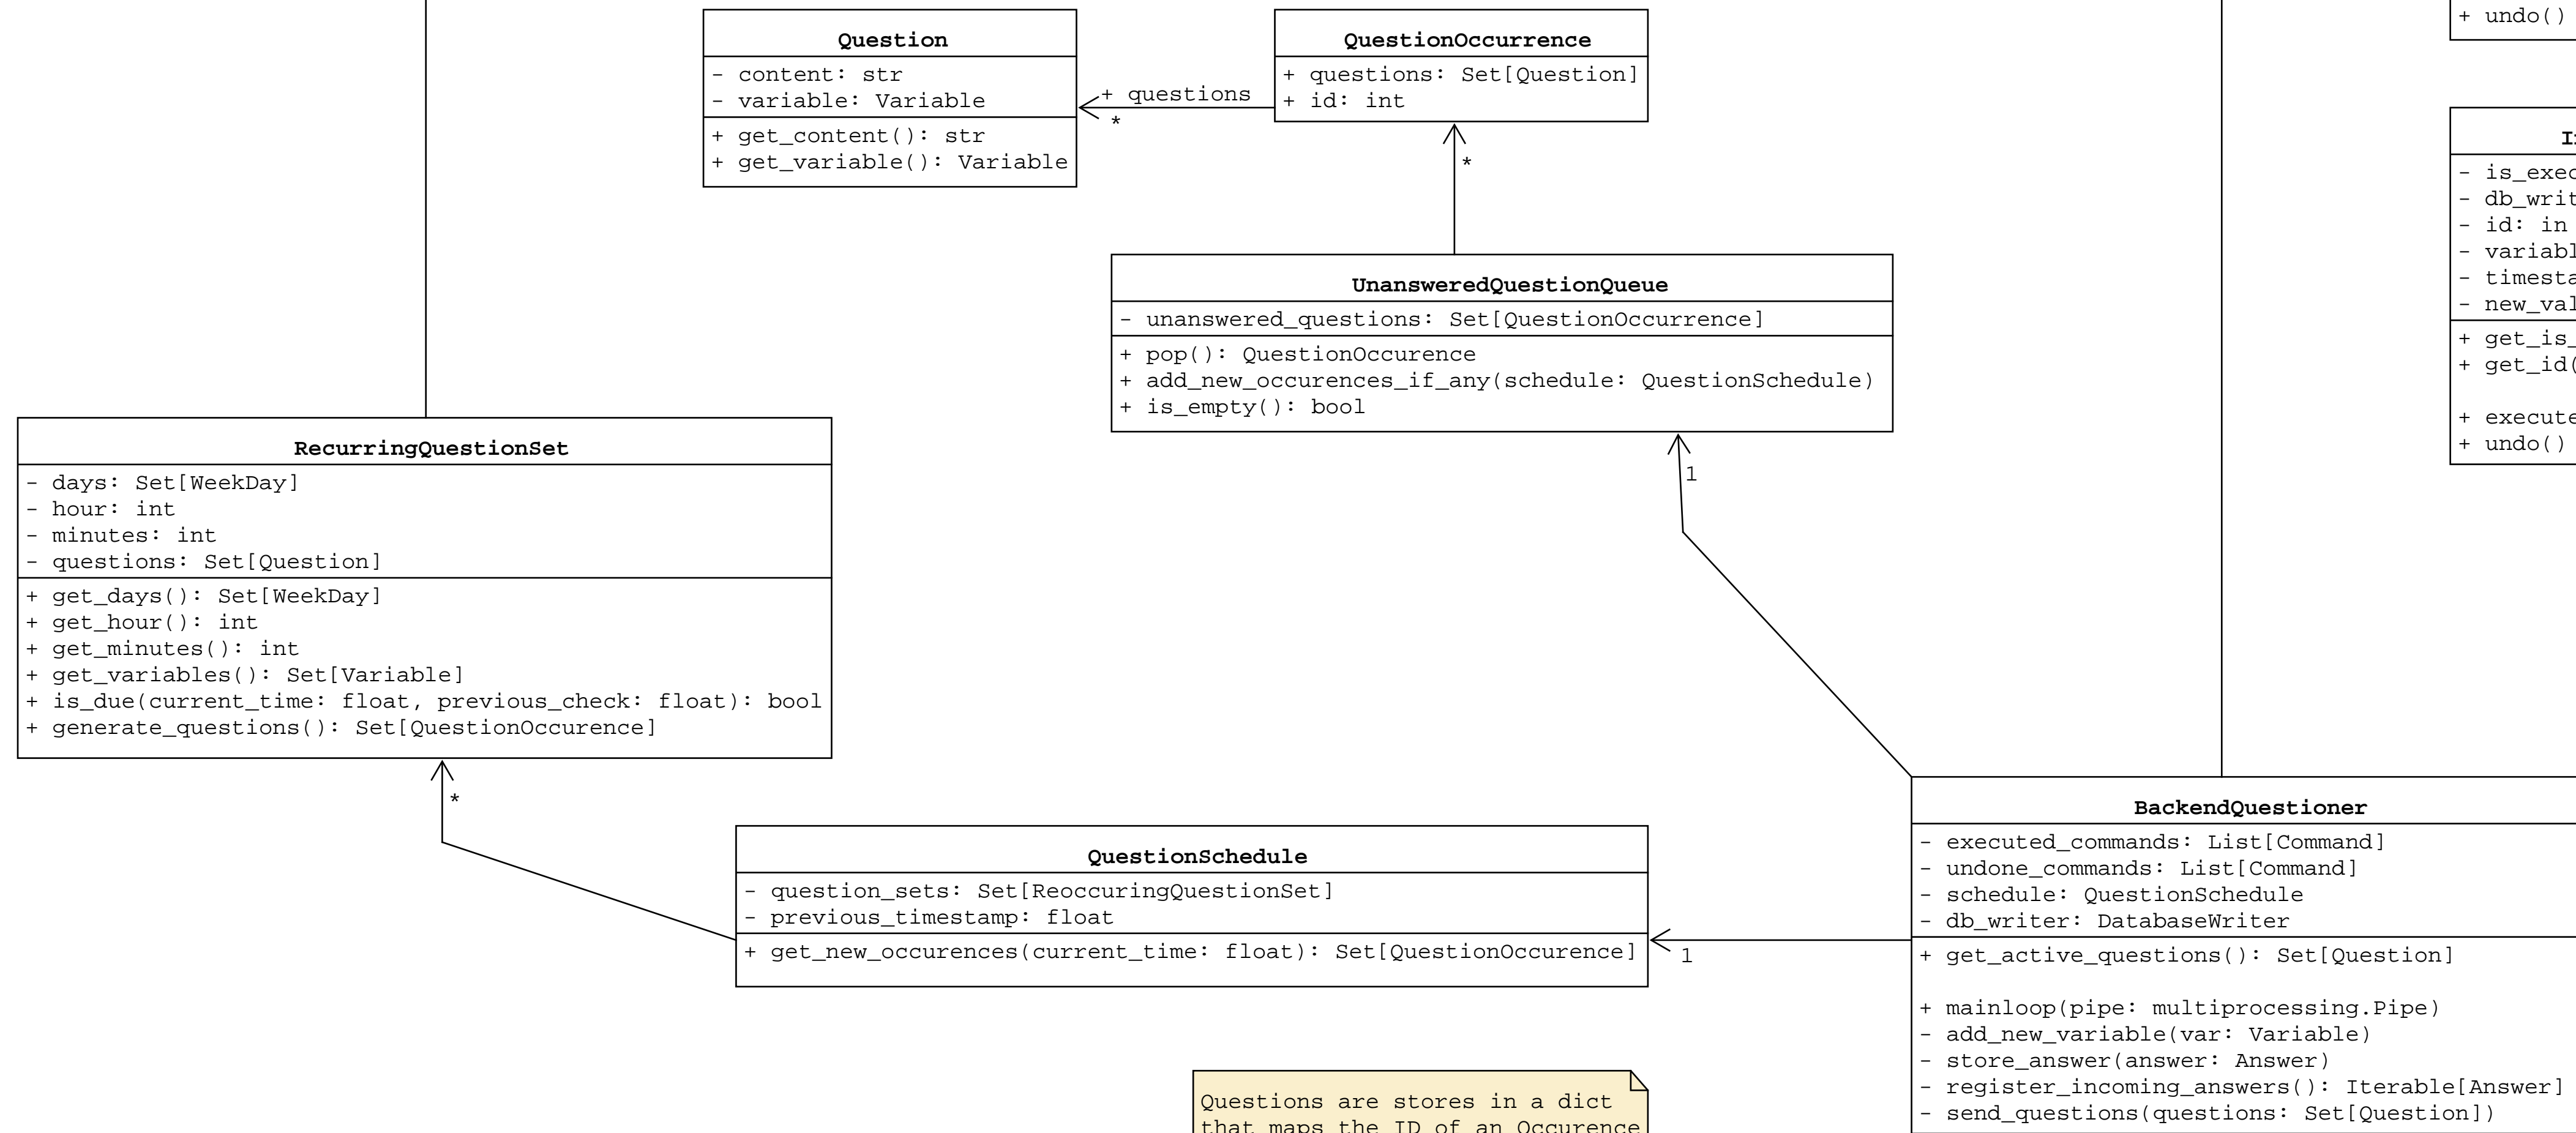

Type is a reserved keyword in Python

Output Production Process

Data Gather Process

We will probably need to use multiprocessing. Perhaps a 'Pipe' to send data between processes. Here it will be used to exchange Questions and Answers. The BackendQuestioner will be able to match a Question to its Answer via their ID.

For commands such as undo or adding a variable we can make new classes. Then the BackendQuestioner can just extract stuff from the pipe, and check the type of the object (answer, new var, undo) to figure out what needs to be done with it.
